hi,

I would like to create a child base widget that floats by itself.

The reason is that I want some event to propagate back to the top level base, but want to be able to move the child widget around(it is a plot window), re-size it and stuff like that.

Reading the documentation, /float seems to apply only to base widgets with group leaders. But then, to pass the information up, I need to create an artificial event, which just does not seem to be the artfull thing to do (one extra programming line).

comments?

tia,

mirko
