Hello,

sometimes I just delete the things I need so urgently...

I want to plot windbarbs on a map projection, and have played with a routine from the the idlmeteo library from the swiss meteorological agency which does just that. That routine, a little bit hacked, seemed to work very well for my purposes - until I deleted that one along with those creating some meteorological symbols...Arghhh!!

Is anyone out there who still has a copy? I couldn't find the library on any ftp-server (I believe I've seen it recently on the creaso server) - it must have disappeared or something.

Thank you very much!

Chris.
