I'm writing a simple class to handle the WAVE RPC interface from C++. Has anyone done this already/would anyone be interested in my class?

If you haven't already done this, what facilities would you appreciate seeing and how would you structure the design. Thus far I've duplicated the set, get and execute utilities of `general_util.c` for integers and floats. I'm interested in what other facilities you think might be useful and what interface you believe would be most suitable.

I don't read this newgroup so if you'd direct your suggestions to seiferth@aquila.plk.af.mil I'd appreciate it. If you already have a working class, I'd appreciate hearing about that also.

Thanks...

Justin
