Hi everybody,

we are considering to buy a new IBM RS/6000 workstation, which will mainly run IDL (image processing, fitting, large datasets). In particular,

we are looking at the Model 397 and the brandnew model 43P-260. Has anybody run the IDL-benchmarks ("time_test") on these machines? in what configuration? Or does anybody know where such information might be available?

If possible, please email also directly to:
kienlin@physik.uni-wuerzburg.de

thanks and cheers,
Markus
