
Subject: plots overlaid on map projections?

Hi,

I want to use PV-WAVE to plot some contour (& other) plots overlaid on maps of the world. These maps should be in Mercator and polar projections (and possibly others as well). I also want to be able to select a region of such an overlay with the mouse, and find out what region of the map and part of the contour plot is contained in the selected region.

Has anyone been able to use PV-WAVE's (unsupported) Map Library for this purpose? It handles the drawing of maps directly, but what about the overlaying of plots and selection of regions from such plots?

Failing this, has anyone been able to do something like this in some other way?
