I have got this to work without doing anything special.
It was quite useful for logging on to a machine in California
from here in Scotland on a bad internet day, espcially with UNIX here
and VMS there. You do have to be typing
in the TEK window which has rather odd line-editing compared to the normal VT
window.

Quick reality check: You did switch the xterm into tektronics mode, didn't you?
(If not, do ctrl-middlemousebutton and select "switch to tek window"
from the popup menu which appears.) If you forget this, you will get a
lot of gibberish on your xterm's default VT window.

On the other hand, you say this has worked for other plotting programs,
so you must have done this.

You can always try

```
IDL> set_plot,'tek'  
IDL> device, file='gak.tek'  
IDL> plot,[0,1],[0,1]  
IDL> device,/close
```

to dump the TEK plotting commands to a file.

You can then switch to the TEK part of an xterm and do

```
unix.prompt> cat gak.tek
```

If your plot appears, then IDL is generating OK tek commands for your xterm,
it just isn't sending them to the right place.

All the best

Hugh
