i need to plot SPEC as a function of PPM. PPM has values from 12.0 to -12.0 (NOTE: not from -12.0 to 12.0).

If I say PLOT,PPM,SPEC I get correct plot except that the X-axis is labeled from -12.0 to 12.0. How do I

get the correct annotation on the X-axis?

Presently I convert the PPM array to a array of strings and sample it properly and give it as a variable for xtickv keyword. It works fine except that handling xrange this way is not easy. Is there a better and easy way to do this?

Thanks
