Function POLY_INSIDE (below) does this, for an n-vertex polygon.

I don't know how robust it is; please test it thoroughly before relying on it.

```
;+
; NAME:
;   POLY_INSIDE
;
; PURPOSE:
;   This function determines if points are inside/outside a polygon.
;
; CATEGORY:
;   Geography, Geometry.
;
; CALLING SEQUENCE:
;   Result = POLY_INSIDE(X, Y, XP, YP)
;
; INPUTS:
;   X,Y:      X, Y position(s) defining the point(s) to be tested. Can
;             be vectors.
;
;   XP,YP:    Vectors of X, Y positions defining the polygon.
;
; INPUT KEYWORDS:
;   EDGE:     Set this keyword to accept edge (& vertex) points as
;             "inside". Default is to reject them. Note that this feature
;             is still not implemented properly.
;
; OUTPUTS:
;   The function returns 0 if the point is outside the polygon, 1 if
;   it is inside the polygon.
;
; PROCEDURE:
;   This routine uses the fact that the sum of angles between
;   lines from a point to successive vertices of a polygon is 0
```

```

; for a point outside the polygon, and +/- 2*pi for a point
; inside. A point on an edge will have one such successive angle
; equal to +/- pi.
;
; EXAMPLE:
;
; MODIFICATION HISTORY:
;   Mark Hadfield, June 1995:
;     Written based on ideas in MATLAB routine INSIDE.M in the WHOI
;     Oceanography Toolbox v1.4 (R. Pawlowicz, 14 Mar 94,
;     rich@boreas.whoi.edu).
;
;-
function POLY_INSIDE, X, Y, XP, YP, EDGE_INSIDE=edge

; Check geometry of the array of points. Note that this array
; is treated as a 1-D array internally to allow matrix operations,
; but the array structure and shape is restored on output.
n = n_elements(X) & s = size(x)

; Make a local copy of polygon data
; If necessary, add a last point to close the polygon
xpp = xp(*) & ypp = yp(*) & npp = n_elements(xpp)
if xpp(npp-1) ne xpp(0) or ypp(npp-1) ne ypp(0) then begin
    xpp = [xpp,xpp(0)] & ypp = [ypp,ypp(0)] & npp = npp+1
endif

case npp of

    1: if keyword_set(edge) then $
        return, fix(x eq xpp(0) and y eq ypp(0)) $
    else $
        return, reproduce(0,x)

    else: begin

        ; The following matrix operations return (npp,n) arrays
        containing
        ; distances from points to vertices
        dx = xpp#replicate(1D0,n) - replicate(1D0,npp)#x(*)
        dy = ypp#replicate(1D0,n) - replicate(1D0,npp)#y(*)

        angles = (atan(dy,dx))
        angles = angles(1:npp-1,*)-angles(0:npp-2,*)
        oor = where(angles le -!dpi,count)
        if count gt 0 then angles(oor) = angles(oor) + 2.*!dpi
        oor = where(angles gt !dpi,count)
        if count gt 0 then angles(oor) = angles(oor) - 2.*!dpi
    end
endif

```

```
    return,round(total(angles!/dpi,1)) ne 0  
  
end  
  
endcase  
  
end
```

Really!?

Sure enough. I have to go read that page more often. :-(

http://www.dfanning.com/tips/point_in_polygon.html

Cheers,

David
