
Subject: Bug in BREAKPOINT procedure?

I'm using PV-WAVE v4.00 under ULTRIX on a DECstation

I'm trying to use the breakpoint procedure.

WAVE lets me set breakpoints at some points in a given routine, but not at others, coming back with the error message:

```
% BREAKPOINT: Unable to find code corresponding to given source line.  
% Execution halted at $MAIN$ </dev/tty( 1)> (BREAKPOINT).
```

Has anyone any idea as to the cause and/or solution to this problem

Thanks in advance,
