
Subject: Calling Fortran routines from IDL

Hello IDL experts,

I have been using IDL student version. However, I am also using Fortran 77/90. I heard there is a method to call fortran subroutines (77, 90, or both?) from IDL professional version. If that is true, it will enable me to link my fortran routines and other great fortran routines out there to IDL, which is great to me!

However, I have watched the discussion about "math toolbox". That discussion may indicate that the communication between fortran and IDL is not that easy.

Would you give me information about this topic?

Thanks.
