Hi,

Is type conversion error an I/O error? In my error handling, there is a possibility theat a user will goof and an alphabetic string is attempted to convert to float. For that (and other), I put in "catch", but type conversion error gets passed to "on\_IOerror" in the upper-level routine instead of being handled by local "catch".

I know that "on\_IOerror" supercedes "catch" for file I/O but type conversion error does not seem to be the case for it. Wierd. After all, how did RSInc classify errors? Which are I/O, and which are "the rest"?

I will appreciate any word of wisdom on this.

Pavel
