
Subject: Format strings with comma separated lists

I hoping that someone else understands format strings better than I do, because I can't get them to work at all. I was wondering if anyone knew how to read a comma delimited list using format strings, such as

```
Readf, lun, variable, FORMAT='(n(F6.6, :, ","))'
```

...this is the way I would think that you should do it but this just tells me that end of input record encountered.

Does anyone know how to do it?#

Cheers,
Phil Aldis
