Subject: color line IDL graphics on a terminal emulator (kermit?)

I would like to use Kermit or some other (public domain, preferably)
pc terminal emulator to do color line graphics in IDL. I have tried
DEVICE,/TEK4100,col=16 & plot,[1,2],col=4   using the latest kermit
(3.13) and I only get one colour (white). This is not surprising from
what I read in the respective manuals, but I would be surprised
(given that there are so many kermit users and IDL/Wave users out there)
if there is not a significant subset who want to use colour.
