Subject: Ploting some data during fortran code execution

Hi, all.

I'm solving a nonlinear optimization problem.
In my code, optimum solution is computed by iterative scheme.
(I used L-BFGS-B routine.)
In this case, I want to trace the shape of solution during iteration.
To do that, I must plot that data during execution of executable made by

fortran code.
In pv-wave, it was possible by using 'waveinit', 'wavecmd', 'waveterm'.
However, It looks impossible in idl, because idl don't have 'waveinit',
'wavecmd', 'waveterm'.
Is there any method to execute idl commands in fortran program.
