Dear All,

I would like to implement a series of projection transformation routines
(i.e basic Geo Lat

Long to a National (UTM like) projection) for coordinate pairs. There is
a C library

(general cartographic transformation package) GCTP available from the
United States

Geological Service (USGS), this seems to be the standard routines for
projection

transformations. By any chance does anyone know if these routines have
been converted

to IDL, and if so are they available.....

Thanks for your thoughts.

Rich.
