Hi,

I've got a problem with pv-wave 6.21(Linux):

the image&background colors are not set properly.

(darkgreen plot color on black background!!!,...)

So, I hopefully started the color table widget to
change colors - that was when I realized that there

had to be a major bug - instead of the expected

full color spectrum all I could see were 11 colors

(black, blue, green).

I don't believe this is a problem with my X-server.

Can anyone help??

thanks in advance,

Volker
